A) The ACT-IR303FM Suite

"IrFM And Fast Connect Debug/Test Suite" is a set of hardware/software designed to test and debug IrFM and Fast Connect for IrFM PTD and/or POS under development.

B) Benefits of ACT-IR303FM Suite

1) Facilitates testing and debugging of IrFM and Fast Connect for IrFM PTD and/or POS.
2) Promotes inter-operability of IrFM and Fast Connect for IrFM PTD and POS.
3) Speeds up the IrDA certification process.
4) Speeds up time to market.

C) Hardware/Software Included in the Suite

1) IrFM PTD with Fast Connect Simulator Hardware (IR103SP) and SW (ACTiLinkPTD).  
2) IrFM POS with Fast Connect Simulator Hardware (IR103SL) and SW (ACTiLinkPOS). 
3) IrFM with Fast Connect Recording Hardware (IR910D) and Software (IR912SW). 
4) IrFM with Fast Connect Recording Analyzer Software (IR913SW).

C-1) IrFM PTD And Fast Connect Simulator (ACTiLinkPTD and IR103SP)

1) This program runs in a PC (not included) and uses a special IrDA dongle (IR103SL, included in this Suite) to simulate different kinds of IrFM PTD, performing IrFM with Fast Connect functions.
2) Under software control, the simulated PTD (Personal Trusted Device, e.g. cellphone, PDA, e-wallet) can use either standard power or low power IrPHY. 
3) Under software control, the simulated PTD can use either 1.6 usec or 3/16 bit-time IR pulses.
4) Under software control, the simulated PTD responds to XID from POS with either XID at 9.6 kb/s, XID at 115.2 kb/s, or UA at 115.2 kb/s. (These are the three options defined in Fast Connect.)
5) Configuration files are supplied. These files direct the PTD Simulator to test POS according to IrDA IrFM Test Spec.

C-2) IrFM POS And Fast Connect Simulator (ACTiLinkPOS and IR103SL)

1) This program runs in a PC (not included) and uses a special IrDA dongle (IR103SL, included in this Suite) to simulate IrFM POS with Fast Connect functions.
2) The visiting PTD can use either standard power or low power IrPHY.
3) The visiting PTD can use either 1.6 usec or 3/16 bit-time IR pulses.
4) The visiting PTD can use either 0xFF or 0xC0 as XBOF when needed.
5) The visiting PTD can respond with either XID at 9.6 kb/s, XID at 115.2 kb/s, or UA at 115.2 kb/s. (These are the three options defined in IrFM with Fast Connect.) This simulated POS can auto-detect the data rate and perform Fast Connect accordingly.
6) Under software control, this simulated POS can vary its 1-slot XID polling period between 55 msec and 300 msec as specified in Fast Connect.
7) Script files are supplied. These script files direct the POS Simulator to test PTD according to IrDA IrFM Test Spec.

C-3) IrFM With Fast Connect Recording Program (ACT-IR912SW and IR910D)

1) This program runs in a PC (not included) and records the conversation between PTD and POS at data rates of 9.6, 19.2, 38.4, 57.6, or 115.2 kb/s. (It changes data rate automatically to follow the conversation.)
2) This program uses a special IrDA dongle (ACT-IR910D, Dual-Head IR220L+, included in this Suite) to receive from both the PTD and POS. It never transmits.
3) If there is a collision or if there is IR interference, this program will record an error. The corrupted IR data from either the PTD or POS are lost.
4) This program is aware of the rules specified in IrDA IrFM with Fast Connection and IrLAP Negotiation Procedures. It will automatically change the data rate of its receivers, according to these rules and correctly follow the conversation between the PTD and POS. But if the PTD or POS changes data rate not according to these rules, this program may not be able to follow the conversation after that point.
5) Every byte of IR received is time-stamped and recorded in a binary file.

C-4) IrFM With Fast Connect Recording Analyzer (ACT-IR913SW)

1) This program reads the binary file generated by the Recording Program and transcribes the information into three ASCII text files.
2) The first text file has all the details at the IrPHY level. It shows all the IR bytes received, including IR-noise, XBOF, BOF, byte stuffing, CRC, EOF, etc. It organizes these bytes
into IrPHY frames whenever possible. It also includes timing information in msec with 0.1 msec resolution to show inter-frame gaps, inter-byte gaps inside the frame if any, and total transmission time of each frame. CRC is also checked at this level.

3) The second text file has only the details at the IrLAP level. The timing information and frame wrapper are stripped. Proper sequencing of Nr and Ns are checked at this level.

4) The third text file has only the details at the IrLMP level. That is, only the payload of IrLAP I-frame is shown. This includes the IrLMP Destination, IrLMP Source, TinyTP and all upper layer data.

5) The fourth text file has only the details at the TinyTP level.

6) All frames in the above 4 text files are assigned arbitrary but unique sequential numbers for easy cross-referencing between these 4 text files.

D) IrFM and IrDA Block Diagram

ACT-IR303FM only addresses IrPHY+IrLAP with Fast Connect+IrLMP+TinyTP+IAS+IrFM OBEX Transport (the green color section in diagram shown below). It does not include the full stack, but does address the testing of, other IrFM protocol layers, which must be a part of the host system application software: IrFM OBEX/Core IrFM Protocol/Proprietary Services/Core IrFM Services/IrFM Application (the gray color section in diagram below).
E) IrFM Implementation Strategy

For IrFM implementation in POS system, there are two approaches:

E-1) IrFM Implementation Plan 1 – To Port Full IrDA and IrFM Protocol Layers

1) Port the full IrDA and IrFM protocol layers onto the POS microprocessor.
2) POS manufacturer needs to port and integrate these IrDA protocol layers properly with POS host system software.
3) POS manufacturer needs to test for compliance with IrDA and IrFM spec.
4) POS manufacturer needs to implement properly IrDA and IrFM And Fast Connect physical components (transceiver, encode/decode IC) and PCB layout.
5) In case of IrFM or IrOBEX correction or updates, POS manufacturer may need to re-do (1) - (3) above, again, each time to meet IrReady spec.
6) IrLAP with Fast Connect may not be optimized to perform fast enough connection.

E-2) IrFM Implementation Plan 2 – To Partition IrFM from IrDA Protocol and IrPHY

1) Port IrFM and IrOBEX protocol layers onto the POS microprocessor.
2) Use ready made and pre-tested IrDA/FastConnect internal PCB or chip set, which includes IrDA core protocol layers and IrDA Physical (with IrFM Fast Connect).
3) IrFM POS system is easier and quicker to pass IrReady certification tests.
4) In case of IrFM or IrOBEX correction or updates, POS manufacturer needs not to touch the performance and IrReady sensitive IrDA/FastConnect module.
5) Much faster to pass IrReady certification tests, and time to market, even after each application revision.
6) An example of such ready made/pre-tested IrDA/FastConnect internal PCB, ACTiSYS ACT-IR103SLi (uses chip set: ACT-IR8203LM5VP) is shown below:
F) IrLAP+Fast Connect, IrFM Profile, and IrDA Protocol Documents

F-1) IrLAP And Fast Connect Spec.

"IrLAP And Fast Connect (Application Note), Version 1.0", IrDA, Nov. 2002

F-2) IrFM Profile Spec. IrFM Test Spec.

"IrFM Point and Pay Profile, Version 1.0", IrDA, Dec. 2002
"IrFM Qualification Program, Version 0.3", IrDA, Nov. 2002
"IrFM Lower Layers Test Spec., Version 0.1", April, 2003

F-3) IrDA Protocol Spec.

F-4) IrDA Protocol+FastConnect and IrPHY Module (ACT-IR8203LM) Spec.
